To all Buffalo Wild Wing Franchisee's Owners,

Early in 2004, I was approached by South-Tek Systems regarding installing a *BeerBlast™ -Mixed Gas Dispense System* into our short draw draft beer system. As with any draft system that is not equipped with a CO2/N2 gas blending system, we were experiencing problems with overfoaming and having the keg "kick" with 6%- 8% of the beer (in the form of foam) left in the bottom.

The *BeerBlast™* has an integral McDantim CO2/N2 blender and Nitrogen generator. The installer, within 2 hours, mounted the *BeerBlast™* to the wall, out of the way, near our cooler and it has functioned flawlessly since.

The addition of the *BeerBlast™* has significantly decreased our beer cost, hence it has increased our profits. We now drain the kegs completely and there is no more overfoaming at the tap! I recommend that anyone using a short or long draw draft beer system, install the *BeerBlast™* to maximize their beer revenue potential.
