

## Nitrogen Flow Verification Program For Industrial Applications

South-Tek Systems now offers the *Nitrogen Flow Verification Program* designed for your company to verify your Nitrogen flow rate requirements prior to purchasing a Nitrogen Generator. This ensures the Nitrogen Generator you purchase will be sized correctly for the flow requirements of your Nitrogen gas application.

The flow meter is housed within a pre-determined threaded pipe length. It connects in line to your existing Nitrogen gas piping configuration and features an easy-to-read flow rate LED display. With the Nitrogen Flow Verification meter in place, simply plug the meter into a 110V outlet and use the LED display to monitor and record the maximum nitrogen flow rate used in your process. Once your test has been concluded, remove the Nitrogen Flow Verification flow meter pipe section and reconnect your piping to its original configuration for continued process use.

Provide South-Tek Systems with the maximum flow rate realized during your test and we will size a N2-Generator properly to meet your Nitrogen usage needs.
