

The BeerBlast™

Mixed Gas Dispense System

Now Equipped with.....

The **BlastOff™** – *Leak Detection System*, a **Patented** system, when installed into the BeerBlast™ will detect line leaks within the downstream gas lines from the BeerBlast™ to the kegs. Line leaks could be due to a keg not being tapped correctly, a beer gas line failing, regulator malfunction, etc. These leaks are potential safety hazards since harmful and deadly gasses can quickly accumulate in the keg cooler. These gases are odorless and unknowingly can lead to suffocation. Not only can leaks be a tremendous liability but they also deplete the gas powering your draft beer system and lead to costly gas run-outs which result in revenue loss for your restaurant/pub. With the BlastOff™ warning mechanism, it eliminates any downtime by notification of a leak when it occurs.

Once a leak has been detected, the BlastOff™ is set to initiate a buzzer, activate a warning light and shut off the BeerBlast™. The instructions on the front of the BeerBlast™ recommend calling our 24/7 customer support number or contacting your local gas company to locate the leak. There will be no downtime since all one has to do is simply turn off the power switch and turn it back on. The BeerBlast™ will be up and running once again until the leak in your draft beer system can be properly diagnosed. Save money, time, aggravation, decrease your liability and also protect your BeerBlast™ from excessive runtime due to either a catastrophic or pinhole leak downstream!
